Свойства определённого интеграла, связанные с промежутком интегрирования. Аддитивность на отрезке.

$$1) \quad [a, \beta] \subset [a, b] \\ f(x) \in Y_{\mathbb{R}} [a, b] \quad \Rightarrow \quad \int_a^{\beta} f(x) dx$$

Доказательство: $\int_a^{\beta} f(x) dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(\xi_i) \Delta x_i$

$$\forall \varepsilon > 0 \exists \delta > 0 \quad \forall P, \xi_i \quad n < \delta \Rightarrow |\sigma - y| < \varepsilon$$

$$\neq [a, \beta] \quad \overline{P}; \quad \sum_{i=1}^n f(\xi_i) \Delta x_i = \sigma_{[a, \beta]} + \sigma_{[a, b] \setminus [a, \beta]}$$

$$\left| \int_a^{\beta} f(x) dx - \int_a^b f(x) dx \right| = \sum_{i=1}^n M_i \Delta x_i - \sum_{i=1}^n m_i \Delta x_i = \sum_{i=1}^n \omega_i \Delta x_i$$

$$\leq \sum_{i=1}^n w_i \Delta x_i + \sum_{i=1}^n w_i \Delta x_i \quad [a, b] \setminus [\alpha, \beta] =$$

$$= \sum_{i=1}^n w_i \Delta x_i < \varepsilon \quad (\text{поэтому можно на } [a, b])$$

$$y = f(x) \in Y_{\mathbb{R}} [a, b])$$

$$2) \bullet \int_a^b f(x) dx = 0 \quad ; \quad \bullet \bullet \quad a < b \Rightarrow \int_a^b f(x) dx = - \int_a^b f(x) dx$$

$$\int_a^b = \lim \sum f(\xi_i) (x_i - x_{i-1}) = - \lim \sum f(\xi_i) (x_{i-1} - x_i) = - \int_a^b$$

$$\bullet \bullet \bullet \quad \int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$$

$$\int_a^b f(x) dx = \int_a^c f(x) dx - \int_b^c f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$$

3) Eine $f(x) \leq g(x)$ $\forall x \in [a, b]$ mo

$$\int_a^b f(x) dx \leq \int_a^b g(x) dx$$
